

EPISODE 03 • STUDY NOTES

Fields & Data Types in Salesforce

A complete, easy-to-revise breakdown of the video — with tables, diagrams, and a step-by-step field-building guide.

1

Introduction

0:00 – 0:40

In Episode 2, we learned what Objects are and created our first Custom Object — **Student**. Now that we have an Object, the next question is: **how do we store information inside it?** The answer is **Fields**.

By the end of this lesson, you will know:

- What Fields are
- Why we need them
- Different Field Data Types
- How to create fields inside our Student object

2

What are Fields?

0:40 – 2:30

Continuing with the Student Object example, what information do we actually want to store for each student?

Information Needed	Stored As
Student Name	A Field
Roll Number	A Field
Email	A Field
Phone Number	A Field
Date of Birth	A Field

Each of these individual pieces of information is called a **Field**.

SIMPLE ANALOGY

**If an Object is a table,
Fields are the columns of that table**

*In short: **Objects** store records, and **Fields** store the details of those records.*

3 What are Data Types? 2:30 – 5:30

Not every field stores the same kind of information. A Student Name contains text, Phone Number contains numbers, Date of Birth stores a date, and Email stores an email address. This is exactly where **Data Types** come in.

A **Data Type** tells Salesforce what kind of information a field is allowed to store — keeping data accurate and organized.

Common Salesforce Data Types

Text

Names, City, Address

Number

Age, Marks, Salary

Email

Email Addresses

Phone

Contact Numbers

Date

Birth Date, Joining Date

Checkbox

Yes / No values

Picklist

Select one value from a list

Long Text Area

Description or Notes

Choosing the correct Data Type helps keep your data **accurate, consistent, and easy to report on** later.

4 Practical Demo: Add Fields to Student 5:30 – 8:30

Let's add real fields to the Student Custom Object we created in Episode 2.

- 1 Open the **Student** Object in Salesforce.
- 2 Go to **Fields & Relationships**.
- 3 Click **New**.
- 4 Create each field below, one at a time, choosing the matching Data Type.
- 5 Click **Save** after each field.

Fields Created in This Demo

Field Name	Data Type
------------	-----------

Roll Number	Number
Email	Email
Phone Number	Phone
Date of Birth	Date
Gender	Picklist
Active Student	Checkbox

Result: After saving all six fields, the Student Object is now ready to store complete student information — name, roll number, contact details, birth date, gender, and active status.

5 Object vs. Field vs. Data Type

Recap Diagram

6 Episode Summary

8:30 – 9:00

- ✓ What Fields are — the **columns** that hold record details inside an Object
- ✓ What Data Types are and why Salesforce needs them
- ✓ Why choosing the correct Data Type keeps data accurate and organized
- ✓ How to create fields inside an Object (Roll Number, Email, Phone, DOB, Gender, Active Student)

Coming up next: We'll start creating actual **records** inside the Student object and learn how to work with the data we've set up.
