

What are Objects in Salesforce? Create Your First Custom Object

A complete, easy-to-revise breakdown of the video — with tables, diagrams, and quick-recall summaries.

1 Introduction

0:00 - 0:40

In the previous episode, we understood what CRM is, why businesses need it, and why Salesforce leads the CRM market. Now that the purpose of Salesforce is clear, it's time to learn one of the most important building blocks of the platform — **Objects**.

Almost everything in Salesforce revolves around objects, so understanding this concept well makes everything that follows much easier.

By the end of this lesson, you will know:

- What an Object is
- Why Objects are needed
- The types of Objects in Salesforce
- How to create your very first Custom Object

2 What is an Object?

0:40 - 3:00

Let's understand this with a simple example. Imagine you own a school and need to store information about students — Name, Roll Number, Class, Email, Phone Number, Address, and so on.

Where would you naturally store all of this? — In a **table**.

Similarly, a company may want to store customer information, employee information, product information, or order information. In Salesforce, these tables are called **Objects**.

An Object is simply a database table that stores information about a particular type of record.

Common Salesforce Objects and what they store:

Object	What It Stores
Account	Company information
Contact	Customer or contact information
Opportunity	Sales deals
Case	Customer support requests

Every single record you create in Salesforce is stored inside some Object.

3 Types of Objects

3:00 - 5:00

Salesforce mainly provides two types of Objects:

1. Standard Objects

Already provided by Salesforce — no need to create them.
Examples: Account, Contact, Lead, Opportunity, Case.

2. Custom Objects

Created by you when your business has unique needs Salesforce doesn't cover by default.

Why Custom Objects are needed — real examples:

Business	Unique Record They Need to Store
School	Student records
Hospital	Patient records
Car Showroom	Vehicle records

Since Salesforce doesn't provide these by default, we create our own **Custom Objects** — exactly what we'll do next.

4 Practical Demo — Create a Custom Object

5:00 - 8:30

Now let's switch to Salesforce and build the Student object step by step.

- 1 **Go to Setup** — open the gear icon and click Setup.
- 2 **Search for Object Manager** — use the Quick Find/Search box.
- 3 **Click Create → Custom Object** — this opens the new object form.
- 4 **Fill in the object details** (see table below).
- 5 **Leave remaining settings as default and click Save.**

Custom Object configuration used:

Label	Student
Plural Label	Students
Record Name	Student Name
Data Type	Text

Congratulations! You've just created your very first Custom Object in Salesforce.

You can now add fields, store records, and customize it according to your business requirements — covered step by step in upcoming videos.

5 Standard vs. Custom Objects

Recap Diagram

STANDARD OBJECTS

- Built into Salesforce by default
- No setup required
- Examples: Account, Contact, Lead, Opportunity, Case
- Cover common, universal business needs

CUSTOM OBJECTS

- Created by the Admin/user
- Built via Object Manager
- Examples: Student, Patient, Vehicle
- Cover unique, business-specific needs

6 Conclusion

8:30 - 9:00

In this episode, we covered:

- What an Object is
- Why Objects are used in Salesforce
- The difference between Standard Objects and Custom Objects
- How to create a Custom Object from scratch

Coming up next: Fields in Salesforce — the different field types, and how to add fields to the Student object we created today.

✓ Episode Summary

- ✓ An Object is a database table that stores records of one type
- ✓ Standard Objects come built into Salesforce (Account, Contact, Lead, Opportunity, Case)
- ✓ Custom Objects are created for business-specific needs (e.g. Student, Patient, Vehicle)
- ✓ Custom Objects are created via Setup → Object Manager → Create → Custom Object
- ✓ We created our first Custom Object: *Student*
